NeuroSleep — Business Proposal

An honest business case for an early-stage concept.

A note before anything else

I snore, and I've dealt with enough bad sleep — mine and other people's — to want to build something better than a passive pillow. I'm not a hardware engineer. This document reflects a concept I developed using AI tools: product direction, system design thinking, and market positioning. It is not a finished company, and I won't pretend it is.

1. The Problem

Insufficient and poor-quality sleep is one of the most commonly reported health complaints in surveys across developed countries. Most existing products are either passive comfort items (mattresses, pillows) or tracking-only tools (wearables, apps) — few close the loop between sensing and real-time physical adaptation. That gap is the opportunity this concept targets.

2. The Concept

A smart pillow with embedded pressure sensors and an optical heart-rate sensor (PPG), paired with an on-device AI model that adjusts support height, firmness, and temperature through the night. A companion app would surface sleep reports and manual controls.

Honest note on stage: *no clinical validation, no regulatory submission, and no diagnostic capability exist yet. These would be later milestones pursued with proper testing and the right partner — not claims to make at the concept stage.*

3. Market Opportunity

Metric	Figure	Source
Global sleep tech devices market, 2025	~$29.6B	Mordor Intelligence
Global sleep tech devices market, 2026	~$34.7B	Mordor Intelligence
Projected market size, 2031	~$79.9B	Mordor Intelligence
CAGR, 2026–2031	~18%	Mordor Intelligence

Cross-checked against four other independent research firms, all clustering in the same $27–35B (2026) / ~17–18% CAGR range. Established players — Eight Sleep, Moona, ChiliSleep, ResMed, Oura — already show consumers pay for smart sleep hardware.

4. Business Model (Directional)

Likely a hardware-plus-subscription model — device sale or lease, with an optional app subscription for advanced sleep insights — similar to established competitors in this category. Actual pricing and margins depend entirely on manufacturing costs, which are unknown until a partner with hardware experience is involved.

5. What I'm Asking For

A technical co-founder, hardware/industrial design partner, or small manufacturer willing to build a first prototype together. Compensation structure (equity, co-ownership, or licensing) is open for discussion once there's mutual interest — no specific return or exit timeline is promised, because that isn't something I can honestly offer at this stage.

6. What This Is Not

Not a request to acquire a finished, de-risked asset. Not a claim of clinical validation or regulatory progress. Not a guaranteed-return investment. This is a concept and an invitation to build something real together.
