NeuroSleep — AI-Adaptive Sleep Pillow Concept

Early-stage concept, started by a founder who snores. Seeking a technical or hardware partner.

What it is

A concept for a smart pillow that senses sleep position and pressure, and adjusts support height, firmness, and temperature in real time using an on-device AI model.

Current stage

Product concept and system design direction, developed by one founder using AI tools. **No physical prototype. No patent. No team yet.**

Why it might be worth your time

- Real, growing market: ~$34.7B (2026), projected ~$79.9B by 2031, ~18% CAGR (Mordor Intelligence).
- Proven category: Eight Sleep, Oura, ResMed and others show consumers already pay for smart sleep hardware.
- Clear whitespace: most competitors either track sleep or adjust comfort — few do both in a closed loop.
- A founder with genuine personal motivation and a fully worked-out concept, market position, and business thinking already done.

What I'm looking for / not looking for

A technical co-founder, hardware/industrial design partner, or small manufacturer to build a first working prototype together — not an acquirer looking for a finished, de-risked asset.
