NeuroSleep

Adaptive Sleep System Concept — Project Acquisition Brief
Preliminary buyer review · 14 October 2026

1. Overview

NeuroSleep is a concept-stage project exploring how posture-related inputs, adjustable neck support and a future digital experience might be brought together in a sleep-support product concept. The intended direction is **adapt · monitor · protect · connect**. Sensing, adjustment mechanisms, decision logic, apps and cloud services remain proposed directions; no complete integrated system has been validated.

2. Materials currently available

- Project website and page source files
- Concept film and related media files
- Product concept and preliminary system-architecture direction
- Browser-based rule-driven concept simulation using illustrative inputs
- Application-pathway map and commercialisation materials
- Chinese HTML buyer brief and this English brief

These are candidate materials for preliminary review. This list is not a legal ownership opinion and does not mean every item is cleared for unrestricted transfer.

3. Current stage — important disclosure

> The project does not claim a working integrated hardware prototype, a filed or granted patent, clinical validation, regulatory clearance, demonstrated health benefits, a validated proprietary AI model, a tested sensor-to-actuator loop, a confirmed manufacturing supply chain, revenue, paying customers or a dedicated engineering/clinical team.

Technical feasibility, engineering cost, product safety, intellectual-property boundaries, regulatory pathway and market demand require independent assessment by a prospective buyer.

4. Potential strategic relevance

Companies with capabilities in sleep technology, pillows and mattresses, smart-home products, health hardware, industrial design or manufacturing R&D may assess whether the concept package fits their roadmap. Any value depends on the buyer's existing capabilities, development resources, priorities, verified transferable rights and further investment. This brief does not claim a proven technical moat or independent valuation.

5. Preferred transaction

The seller's preferred route is an overall cash transfer of agreed assets that are verified and legally transferable. Potential scope may include project materials, website source files, concept media, product hypotheses, preliminary architecture drafts and commercial documents. Scope, exclusions, deliverables, payment timing, handover support and rights transfer must be agreed in writing.

Rights review and next steps

Preliminary disclosure for serious buyer evaluation

6. Rights review and exclusions

Rights and provenance are being reviewed item by item. The project does not claim a registered NeuroSleep trademark or any filed or granted patent.

- **Website source files and project documents:** candidate deliverables, subject to final inventory and source review.
- **Project name and visual identity:** no registered trademark right is represented.
- **Concept-film music and media:** the background-music source and licence status have not yet been fully confirmed. These materials are not represented as cleared for unrestricted transfer unless and until verified; they may be excluded or replaced if needed.
- **AI-assisted or generated visuals:** reuse and transfer depend on relevant tool/platform terms, third-party inputs and applicable law; review is required item by item.
- **Third-party fonts, open-source components, platform accounts and hosted services:** governed by their own licences and terms and not automatically included. Non-transferable services will be excluded.

> This is a preliminary disclosure, not a legal opinion or guarantee of title. A detailed asset schedule and relevant licence review should be part of serious buyer due diligence.

7. Suggested evaluation process

1. Confirm strategic fit and the asset scope of interest.
2. If appropriate, agree confidentiality terms before sharing non-public materials.
3. Review the detailed inventory, provenance, intellectual-property and third-party licence questions.
4. Independently assess technical feasibility, safety, regulatory path and development cost.
5. Agree written terms covering price, payment milestones, deliverables, responsibility boundaries and closing conditions.
