NeuroSleep

Adaptive Sleep System Concept — Project Acquisition Brief

Confidential discussion draft • 13 October 2026

Overview

NeuroSleep is an early-stage product concept exploring an integrated sleep system that combines sleep-position sensing, adjustable neck support and a connected digital experience. The concept is intended for evaluation by a company with relevant sleep-tech, smart-bedding, wellness hardware or product-development capabilities.

What currently exists

- Project name and brand expression, subject to asset and rights verification
- Public-facing project website and visual presentation
- Concept film and related media files
- Product concept and preliminary system-architecture direction
- Market-positioning and commercialization materials

Current stage — important disclosure

NeuroSleep remains at the concept and design-direction stage. There is **no complete independently verifiable working hardware prototype, filed patent, clinical validation, regulatory approval, commercial product, verified supply chain, sales revenue or established R&D team** currently claimed.

Adaptive mechanisms, sensors, software, AI functions, app features and cloud services are proposed development directions, not completed or validated capabilities. Feasibility, engineering cost, product safety, regulatory pathway and market demand require independent assessment.

Potential strategic relevance

A buyer already active in sleep technology, pillows or mattresses, wearable/wellness hardware, smart-home products or related manufacturing may be able to assess whether this concept package fits an existing roadmap. Potential value depends on the buyer's needs, the verified rights attached to each asset, development cost and the buyer's own assessment. This brief does not claim proven technical differentiation or a third-party-validated valuation.

Preferred transaction

The project owner primarily seeks an **overall cash transfer** of the project and the assets that can legally be transferred. The exact scope, price, payment schedule, handover support and closing conditions remain subject to discussion and due diligence.

The proposed transfer scope may include the project identity and brand materials, website source files, concept film, product-concept documentation, architecture drafts and commercial materials, **only to the extent ownership and transferability can be verified**. Third-party content, open-source components, platform accounts and non-transferable services are not automatically included.

Suggested evaluation process

1. Confirm strategic fit and the buyer's intended use.
2. Agree on confidentiality and the information needed for preliminary review.
3. Verify asset inventory, authorship, licenses, source files and transfer rights.
4. Conduct technical, legal, third-party-rights and regulatory-pathway review.
5. Discuss a written offer, payment terms, deliverables and closing conditions.
